

Compress Raster Objects

DID YOU KNOW . . . you can reduce the size of the raster objects using the Compression feature in the Raster Extract process?

What Compressing Raster Objects Gives You

- Generate output raster object(s) with smaller storage requirements
- Use compression methods appropriate for different raster types
- Determine image quality selecting from lossy or lossless compression methods

Lossless RLE compression for 1-bit (binary) rasters

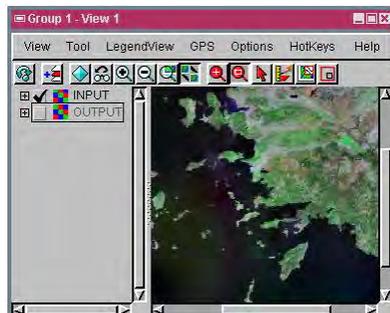

Lossless DPCM compression for signed, unsigned and RGB/BGR (preferred method for signed/unsigned)

Lossless Huffman compression for signed, unsigned and RGB/BGR rasters

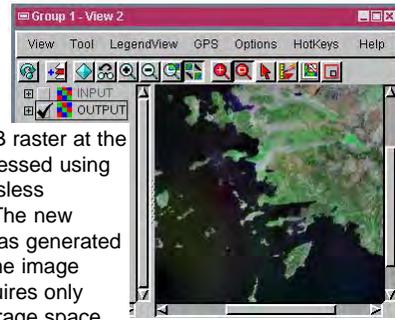

Uncompressed

Lossless or lossy JPEG2000 compression for unsigned or signed up to 16 bit and only RGB/BGR rasters (preferred method for RGB/BGR)

Lossy JPEG compression for 8-bit and 24-bit RGB/BGR rasters

The 24-bit RGB raster at the left was compressed using JPEG2000 lossless compression. The new raster object was generated having the same image quality but requires only 24% of the storage space.

Name	Size	Type
INPUT.rvc	680 KB	MicroImages Project File
OUTPUT.rvc	164 KB	MicroImages Project File

How to Compress Raster Objects

- Select Raster/Extract from the menubar.
- Select the raster object(s) you want to compress when prompted.
- Click on the Special tab in the Raster Extract window.
- Click the Compression option button to select a compression method.
- Click on the Run button.
