# Link to ESRI Personal Geodatabase

DID YOU KNOW . . . you can link to map data layers in ESRI Personal Geodatabase files?

What Linking to an ESRI Personal Database Gives You

- *Maintain spatial elements and attributes in their native format*
- *Link to any or all of the spatial tables in the Geodatabase in one operation*
- *Get a separate linked shape object for each Personal Geodatabase layer*
- *Attribute information for each Personal Geodatabase layer automatically available for viewing and use with DataTips and queries*
- *Base element styling on linked Personal Geodatabase attributes*
- *Optional full import to independent TNTmips vector or CAD object*

View with multiple linked ESRI Geodatabase layers styled using their native attributes.

How to Link to an ESRI Personal Database

- *In the Import process, select the file containing the Personal Geodatabase.*
- *Choose the GEODATABASE format and press the Next... button.*
- *Choose Shape from the Object Type menu in the Import Parameters window, then press the Import... button.*
- *Select or create a Project File and name a shape object for each Geodatabase layer you want to link to.*
