# Manage TNT Temporary Files in Windows

DID YOU KNOW **. . .** *you have control over the folders that store temporary files created by TNT processes in Windows?*

What Managing Temporary Files Gives You

- *Designate drive and folder to keep TNT temporary files*
- *Store temporary files on multiple drives*
- *View and delete temporary files that remained in the specified temporary folder*

Keep this button toggled on to use the default folder set for the TEMP and TMP environment variables to store the temporary files. If this button is toggled off and no other folder is specified, your TNTmips installation directory is used as the default primary repository for the temporary files.

Click to specify a new drive and/or folder to store temporary files.

Click to remove the highlighted path.

Click to remove all paths.

If two folders are defined as the temporary directory, the last added is used as the primary repository. If the two folders specified are on different drives, the folder on a drive with more space is used as the primary repository.

If the TEMP and TMP environment variables folder specified by *Include TEMP and TMP environment settings* button and the folder you specified are on the same drive, the folder specified is used as the primary repository for the temporary files. If not, the folder on a drive with more space is used as the primary repository.

How to Manage Temporary Files in Windows

- *Navigate to your TNT temporary files folder and delete temporary files you find.*
- *Select Tools/System/Preferences from the TNT menubar and click on the System tabbed panel to specify a new repository for the temporary files.*
- *Click on the Add button to specify new location for storing temporary files.*
- *Select the desired path listed in the Temporary Directories pane and click on the Remove button to delete it.*
- *Click on the OK button.*
